

Hey,

Let's create an app which helps user decide what to wear today -

- App should have a login screen with options to login with facebook.
- After logging in, for the first time users it should ask them to add shirts/t-shirts and pants. User should be given option to click pictures or pick image from their gallery.
- There should be a screen which will suggest me what to wear today with a random pair of shirt & pant. This screen will have Dislike and Bookmark button. If I tap on Dislike, it will suggest me a new pair of clothes.
- Bookmark button will let me save a pair for later reference.
- There will be a screen where I can see all my bookmarked pair of clothes.
- Every pair should have a share widget which shares a screenshot/image of the pair.

A basic, to-the-point implementation is what we're looking for. Use material design components. Feel free to be creative!

We will be evaluating you based on your conventions, code clarity, code architecture, problem solving technique, using pre-existing libraries and how good you are at building a mini-product!

Good luck!
